Setting Key Fobs

Set a key fob containing an anti-theft chip as follows:

1). Buy a blank chip key.

2). Use the electronic lock machine to cut the blank chip key to match the lock cylinder slot of the ignition switch.

3). Make another two chip keys available.

4). Insert the first chip key into the ignition switch, turn on the ignition switch, and hold the ignition switch for 3 to 15 seconds. Then, turn off the ignition switch and pull the chip key out.

5). Within 15 seconds, insert the second chip key into the ignition switch and turn on the ignition switch. There will be a buzzing sound 10 seconds later and the anti-theft lamp begins to flicker. Then, turn off the ignition button and pull the chip key out.

6). Within 60 seconds, insert the blank chip key into the ignition switch and turn on the ignition switch. There will be a buzzing sound 10 seconds later and the anti-theft lamp stops flickering. Turn off the ignition switch 3 seconds later. The settings are complete.

Note: The remote control function of a key fob is also set during the setting of a chip key. You can repeat the preceding operations to set a maximum of 8 chip keys.
